METHODOLOGY

Web survey using computer-assisted Web interviewing (CAWI) technology.

From March 26 to March 28, 2021 some 1523 Canadians were surveyed via web panel

Using data from the 2016 Census, results were weighted according to gender, age, mother tongue, region, education level and presence of children in the household in order to ensure a representative sample of the population.

No margin of error can be associated with a non-probability sample (Web panel in this case). However for comparative purposes, a probability sample of 1523 respondents would have a margin of error of $\pm 2.52\%$, 19 times out of 20.
